

Lewis Operating Corp., a premier land developer and builder of master planned communities, is experiencing the benefits of WEB-based, Enterprise-wide computing to manage their diverse operations.

In early 2005, Lewis chose The MASYC Group, Inc. to be their sole partner for implementation of a WEB-deployed JD Edwards EnterpriseOne system. Software modules for this solution include Financials, Accounts Payable, Accounts Receivable, Job Cost, Fixed Assets, and Procurement.

Additionally, MASYC's sophisticated [development capabilities](#) were brought in to provide the following custom applications – all delivered over the WEB.

- **Cash Management** system interface that provides un-cleared check balances, by bank, on a daily basis – improving accuracy and reducing repetitive manual entry and reconciliation.
- **Notes Payable/ Receivable** application that automates voucher and journal entry creation for loan payments, accrual entries, and inter-company transactions – precluding the need for thousands of manual entries every month.
- **Utility and Tax Bill Payment** system that automates the payment voucher process – streamlining the process and preventing duplicate payments.

Working together, Lewis and MASYC were able to design and deliver a solution that provided the following benefits:

- **Improved ability to support a changing and growing marketplace** via a newly designed chart of accounts and cost code structure.
- **Will enable Property Managers to enter their own purchase orders remotely over the WEB, as rollout continues**, expediting their process and providing more control from the field.
- **Provided better decision making for Project Managers** who are now able to review *real-time* project cost information throughout the month (previously, only available at month end).
